

Getting Started with Georgia Adopt-A-Stream

Georgia Adopt-A-Stream (AAS) is a statewide volunteer water quality monitoring program. AAS is housed in the NonPoint Source Program in the Watershed Protection Branch of the Georgia Environmental Protection Division (EPD) and is funded by a United States Environmental Protection Agency (U.S. EPA) Section 319(h) Grant. Georgia Adopt-A-Stream encourages individuals and communities to monitor and/or improve sections of streams, wetlands, lakes or estuaries. Manuals, training and technical support are provided through Georgia EPD and more than 60 established Community Adopt-A-Stream organizers. Adopt-A-Stream Community Programs organize monitoring groups in their watershed, county or city. These local programs are funded by counties, cities and nonprofit organizations and use the Georgia Adopt-A-Stream model, manuals and workshops to promote nonpoint source pollution education and data collection in their area.

The goals of Georgia Adopt-A-Stream are easy to remember by thinking about the word “**ADOPT**”.

Awareness: Increase public awareness of the State’s nonpoint source pollution and water quality issues

Data: Collect baseline water quality data

Observations: Encourage volunteers to take observations of their adopted site and surrounding environment

Partnerships: Encourage partnerships between citizens and their local government

Tools and Training: Provide citizens with the tools and training to evaluate and protect their local waterways

Awareness

Georgia Adopt-A-Stream has been tasked with the goal of increasing public awareness of the State’s nonpoint source pollution and water quality issues. We accomplish this through workshops, outreach materials such as newsletters, manuals and brochures, as well as our annual volunteer conference and by presenting at community events. We encourage our volunteers to also foster this goal, by building awareness within their own communities.

Data

Georgia Adopt-A-Stream houses an online clearinghouse for volunteer water quality data for the State of Georgia. This water quality data is publicly accessible on our website at www.GeorgiaAdoptAStream.org and can be viewed at the city, county and watershed level to help citizens better understand the health of their local waterways. Volunteer monitoring data is used to educate the public and help local, state and federal agencies make informed decisions and to identify water quality impairments.

Observations

Careful observations of our waterways can lead to success in protecting and improving its conditions. In addition to the data found on the datasheets, you may notice other details that are important to record when visiting your adopted site. Stay aware of baseline conditions so if anything changes in future visits, you will be able to tell and can act accordingly.

Partnerships

Adopt-A-Stream encourages new groups to inform their local government about their activities and to create partnerships with local schools, businesses, watershed organizations and government agencies. These partnerships can enhance your program by providing support for your group through data interpretation, advice on restoration techniques, remediation, sponsorships and volunteer recruitment. We cannot emphasize enough the importance of beneficial partnerships to any volunteer monitoring group. If you need help establishing partnerships, we encourage you to contact your local coordinator/trainer or the AAS state office.

Tools and Training

The Adopt-A-Stream program offers many levels of involvement including training, certification and monitoring. Some of our monitoring programs require the volunteer to obtain Quality Assurance/Quality Control certification (QA/QC), which is accomplished by attending a workshop and passing the QA/QC test. This certification allows the volunteer to enter data into the database. Our non-QA/QC programs offer a training workshop and manuals, but certification is not required. Manuals and support materials are provided for each monitoring type to guide volunteers through the monitoring process. To find out more about different levels of involvement, visit our website: http://georgiaadoptastream.org/db/aas_levels.asp

Adopt-A-Stream Certifications and Monitoring Programs For Freshwater and Coastal Waterways

Watershed Assessments (Y)	Visual Monitoring (Q)
Macroinvertebrate Monitoring (Q)*	Amphibian Monitoring (bi-monthly)
Chemical Monitoring (M)*	Bacterial Monitoring (M)*
Freshwater Wetland Monitoring (Q)	Coastal Monitoring (M)*
Lake Monitoring (M)	Rivers Alive (annually)
Trainer Certification*	Adopt-A-Stream in the Classroom

*=QA/QC programs M=Monthly Sampling Q=Quarterly Sampling Y=Yearly Sampling

Currently, Adopt-A-Stream has over 3,400 active volunteers who monitor 470 sites and our quarterly newsletter has over 8,000 subscribers. We invite you to join us to help protect Georgia's water resources.

Water Quality Monitoring

Many water quality parameters can be monitored to help assess the condition of a river, lake or beach area. These can include physical, chemical and biological monitoring. Each of these tells us part of the story about the health of a waterway. Physical monitoring evaluates aspects of the stream including the stability of the streambed and channel as well as the adjacent riparian zone. Chemical monitoring provides a snapshot of the chemical properties at a given time while macroinvertebrate monitoring shows more long term information about the health of the stream. Bacterial monitoring can help citizens determine if the water is 'safe' to swim in. This manual will guide you through visual stream monitoring and why it so important in determining water quality of your adopted site.

Water quality data collected by volunteers for a particular waterway has many uses and benefits along with determining if a particular waterway is safe for recreational purposes. These benefits include:

- **Establishing Baseline Data** – Georgia has more than 70,000 miles of rivers, 400,000 acres of lakes, and 100 miles of coastline - of which, about 20% is monitored on a regular basis. Long-term data collection enables volunteers to take a more active role in protecting their waterways.
- **Assessing Watersheds** – Data generated by volunteers may be used to describe current water quality conditions within a watershed and provide valuable information to water utilities and local decision makers.
- **Educating Citizens** – Volunteers can educate themselves about water quality problems within their watershed. Often this education leads to a sense of “connectedness” to their stream, river, lake or coast and a willingness to promote good stewardship.
- **Targeted Sampling** – Water quality monitoring can help identify sources (hot spots) of pollution caused by stormwater runoff, ruptured or overflowing sewer lines, leaking septic tanks, certain land use operations, industries and other sources of pollution.
- **Total Maximum Daily Load (TMDL) Development and Implementation** – Volunteers can provide data to state agencies developing TMDLs and Watershed Management Plans (also known as TMDL Implementation Plans and Watershed Improvement Plans). The information gathered by volunteers can help with TMDL modeling and help identify effective best management practices (structural and non-structural activities that improve water quality) for improving waterway conditions.

Setting Goals and Designing a Sampling Program

Before starting, first determine your goals. These will guide the level of your participation and help to develop your monitoring program. Where, when, and how often you sample will depend on these goals.

Georgia Adopt-A-Stream offers many opportunities to engage and protect waterways. Follow the below steps to get started, it's simple!

1. **Determine your level of participation and goals.** There are many levels to adopting a waterway. Take your time and think about why you want to monitor, what type of data you want to collect and who may be interested in using your data. Call us anytime if you need advice or guidance, and we can help you through this process:
 - A. Basic level: Conduct one outreach event (i.e. river cleanup) and walk your watershed.
 - B. Monitoring: In addition to 'A,' select a monitoring program(s) that interests your group (visual survey, macroinvertebrate, bacterial, chemical, amphibian monitoring).
2. **Attend a workshop.** Depending on your interest in participating in collecting baseline data, you and your group should attend our monitoring workshops. These workshops are fun and informative!

To learn more about these workshops and to view our workshop calendar, visit www.GeorgiaAdoptAStream.org. If there is not a workshop scheduled for your area, please contact your local coordinator or the State Office and we'll organize one in your area.

3. **Select a site to adopt.** Look around and find a stream, wetland or lake that is important to you. Georgia Adopt-A-Stream does not assign monitoring sites, but can provide guidance and support in your decision. We suggest you find a waterbody that is easy, safe and legal to access.
4. **Create a group.** You will need help when adopting a site to monitor, restore and protect. It's always better to have two sets of eyes collecting data, to help with equipment and costs, and then also for safety reasons.
5. **Register your group and site(s).** Registration forms are on our website under 'Forms & Reports.' Register your group first, then your site(s). To register your site you will need the latitude/longitude location (this can also be generated from our site's Google maps application; you can also call us or your local coordinator for help with obtaining this information).
6. **Get informed, read your manuals!** Get a copy of the manual 'Getting to Know Your Watershed.' To obtain a copy, contact the Georgia Adopt-A-Stream office or download a copy at www.GeorgiaAdoptAStream.org. **Chapter 1** of this manual will give you some basic background on watersheds, land use issues and effects of development. **Chapter 2** provides background on nonpoint source pollution and some of the laws that are used to protect water quality. In **Chapter 3**, follow the directions on how to register your stream, wetland or lake.

7. **Take it slow, be safe and have fun!** Start slowly, ask a lot of questions, tell your neighbors what you are learning, make sure you are being safe when you sample, and most importantly, enjoy yourself!

Safety and Health Checklist

Your safety and health are of number-one importance to Georgia Adopt-A-Stream. There are several important things to remember when you are monitoring your adopted stream, river, lake or wetland. If you follow these “rules of monitoring” you will have a fun, enjoyable and accident-free experience.

Before visiting your site:

- Develop a site emergency plan: (i.e. Site location, nearest medical center, nearest phone, medical conditions of team members and their emergency contact, etc).
- Check weather reports. Stop monitoring if a storm occurs while you are monitoring.
- Determine if you have safe, legal access to your site.

Rules to monitor by:

- Your adopted site should be wadeable or accessible by a bridge. Do not monitor waters that are deeper than your knees.
- If at any time you feel uncomfortable about the condition of the waterbody or your surroundings, stop monitoring and leave the site.
- Do not monitor if the waterbody is at flood stage, or even one day after a heavy rain. Fast moving water is very dangerous. Never wade in swift or high water.
- Never cross private property without the permission of the landowner.
- Always bring your “Who to Call” list on page 89 of this manual.
- Look out for broken glass, poison ivy, and biting/stinging insects.
- Never drink the water and wash hands after monitoring.
- Do not monitor if the water body is posted as unsafe for body contact.
- Carry a first aid kit with you.
- Adopt-A-Stream recommends that you monitor with another person.

Water Quality in Georgia

As outlined in Water Quality in Georgia, 2010-2011, Chapter 1, Executive Summary (Georgia Environmental Protection Division, Department of Natural Resources)

Georgia is one of the fastest growing states in the nation. Between 2000 and 2010, Georgia gained 1.5 million new residents, ranking 4th nationally. The increasing population places considerable demands on Georgia's ground and surface water resources in terms of water supply, water quality, and in the assimilative capacity of rivers to receive wastewaters from industrial and municipal discharges. To address these demands, the General Assembly and Governor Perdue in February 2008 approved the implementation of the Comprehensive State-wide Water Management Plan in Georgia. The regional water plans are not themselves an end. The plans present solutions identified by a cross-section of regional leaders, drawing on regional knowledge and priorities. The plans are based on consistent, statewide forecasts of needs and reflect the best available information on the capacities of Georgia's waters. More about these plans can be found at:

http://gaepd.com/Files_PDF/305b/Y2012_303d/Y2012_Coverpage-Chapter_2_305b.pdf

The pollution impact on Georgia streams has radically shifted over the last several decades. Streams are no longer dominated by untreated or partially treated sewage

discharges which resulted in little or no oxygen and little or no aquatic life. The sewage is now treated, oxygen levels have returned and fish have followed. However, another source of pollution is now affecting Georgia streams. That source is referred to as nonpoint and consists of mud, litter, bacteria, pesticides, fertilizers, metals, oils, detergents and a variety of other pollutants being washed into rivers and lakes by stormwater. Even stormwater runoff itself, if rate and volume is unmitigated, can be extremely detrimental to aquatic habitat and hydrologic systems. Nonpoint source pollution, although somewhat less dramatic than raw sewage, must be reduced and controlled to fully protect Georgia's streams. Structural and nonstructural techniques such as green infrastructure, pollution prevention and best management practices must be significantly expanded to minimize nonpoint source pollution. These include both watershed protection through planning, zoning, buffer zones, and appropriate building densities as well as increased use of stormwater structural practices, low impact development, street cleaning and perhaps eventual limitations on pesticide and fertilizer usage.

Another issue of importance is the reduction of toxic substances in rivers, lakes, sediment and fish tissue. This is extremely important in protecting both human health and aquatic life. The sources are widespread. The most effective method to reduce releases of toxic substances into rivers is pollution prevention, which consists primarily of eliminating or reducing the use of toxic materials or at least reducing the exposure of toxic materials to drinking water, wastewater and stormwater. It is very expensive and difficult to reduce low concentrations of toxic substances in wastewaters by treatment technologies. It is virtually impossible to treat large quantities of stormwater and reduce toxic substances. Therefore, toxic substances must be controlled at the source.

Nutrients also serve a very important role in our environment. They provide the essential building blocks necessary for growth and development of healthy aquatic ecosystems. However, if not properly managed, nutrients in excessive amounts can have detrimental effects on human health and the environment, creating such water quality problems as excessive growth of macrophytes and phytoplankton, harmful algal blooms, dissolved oxygen depletion, and an imbalance of flora and fauna. In Georgia, site specific nutrient criteria have been adopted for several major lakes and their tributaries. Some of these lakes are currently listed for chlorophyll a, which is the primary biological indicator in lakes for nutrient over-enrichment. TMDLs, based on watershed modeling, have been completed or are in development to address the nutrient issues for these lakes. Currently, the Georgia EPD is in the process of collecting the necessary data and information for use in developing nutrient standards for rivers, streams and other waterbodies in Georgia. Determining the relationship of nutrient levels and biological response is necessary in order to develop appropriate nutrient criteria.

It is clear that local governments and industries, even with well-funded efforts, cannot fully address the challenges of toxic substances and nonpoint source pollution control. Citizens must individually and collectively be part of the solution to these challenges. The main focus is to achieve full public acceptance of the fact that what we do on the land has a direct impact on water quality. Adding more pavement and other impervious surfaces, littering, driving cars which drip oils and antifreeze, applying fertilizers and other activities and behaviors all contribute to toxic and nonpoint source pollution. If

streams and lakes are to be pollutant free, then some of the everyday human practices must be modified. The Georgia EPD will be emphasizing public involvement; not only in decision-making but also in direct programs of stream improvement. The first steps are education and adopt-a-stream programs.

Water Resources Atlas

State Population (2012 estimate)	9,383,941
State Surface Area	58,910 square miles
Number of Major River Basins	14
Number of Perennial River Miles	44,056 miles
Number of Intermittent River Miles	23,906 miles
Number of Ditches and Canals	603 miles
Total River Miles	70,150 miles
Number of Lakes Over 500 Acres	48
Acres of Lakes Over 500 Acres	265,365 acres
Number of Lakes Under 500 Acres	11,765
Acres of Lakes Under 500 Acres	160,017 acres
Total Number of Lakes & Reservoirs, Ponds	11,813
Total Acreage of Lakes, Reservoirs, Ponds	425,382 acres
Square Miles of Estuaries	854 square miles
Miles of Coastline	100
Acres of Freshwater Wetlands	4,500,000 acres
Acres of Tidal Wetlands	384,000 acres
